The Grouser AG Pro 12-20 adjustable-width silage dozer gives the operator the ability to hydraulically extend the blade up to 6 m (20 ft) wide when working on the silage pile and retract the blade to 3.7 m (12 ft) wide for transport. The blade was developed with input from custom operators in the forage industry, who wanted easy transport of a packing tractor from job to job and compliance with local road regulations. The AG Pro 12-20 provides width adjustability while retaining the load-carrying capacity of a non-adjustable blade with silage end plates. Individual hydraulic control of the left and right ends of the blade allows flexibility when working on a forage pile. The operator can easily adjust the width of the blade to allow the tractor to get closer to the bunker wall for full coverage packing and improved maneuverability.
